Approval-integrity chain

Approval integrity holds when the executed object is still the approved object, or still inside the approved predicate.

Three included prototypes bind different objects

Twelve of the 15 included reports do not describe a binding check.
Huq et al. (2025) treat silence as acceptance. Pochampally et al. (2026) sent email with no approval of that email.
No included study tests whether people notice when the approved object and the executed object diverge.
